OSTRACODA FROM THE UPPER TEALBY CLAY (LOWER BARREMIAN) OF SOUTH LINCOLNSHIRE

by P. KAYE and D. BARKER

ABSTRACT. Thirty-two species and subspecies of Ostracoda are recorded from the Upper Tealby Clay (Lower Barremian) at Dalby Hill, South Lincolnshire. Three species, Cytherelloidea dalbyensis, Amphicytherura horizontestina and Orthonuacysthure problematica are considered new; two species are left under open nomenclature. Abundance data are given, and the ranges of the species in other British Lower Cretaceous formations are shown.

Since the latter part of last century the Tealby Series of the Wolds of Lincolnshire has been divided into three on a lithological basis (Judd 1867, 1870; Lamplugh 1896). However, the relationship to the beds above and below is uncertain due to a paucity of fossils and exposures. The three lithologic divisions of the Tealby Series are from the base, the Lower Tealby Clay followed by the Tealby Limestone, and at the top the Upper Tealby Clay. In this account we deal only with the ostracods from the Upper Tealby Clay, the major exposure of which in the South Wolds at the present time is the road cutting at Dalby Hill (G.R. TF 409696). In the course of field mapping during the period 1963-4, J. Newton-Smith of Leicester University brought the roadside section at Dalby Hill to our notice. The ostracods found in the washings of his samples prompted the authors to collect further samples during April 1964. The Upper Tealby Clay is generally a dark clay very rich in limonite ooliths; locally it is glauconitic and there are occasional horizons rich in pyrite. Macrofossils obtained from this clay include Liostrea, Oxyteuthis, and Aulacoteuthis. The Ostracoda obtained from this horizon are of Lower Barremian age. The specimens described are all deposited in the collections of the British Museum of Natural History (BMNH), London.

Acknowledgements. The authors thank Mr. J. Newton-Smith for his assistance, and are grateful to other members of Reading and Leicester Universities for help during collection of the samples, and to Mr. J. L. Watkins of Reading University for the photographs.

Kaye and Barker: Ostracoda from the Upper Tealby Clay

Cytherelloidea dalbyensis sp. nov.

Plate 33, figs 1, 2

Holotype. A right valve BMNH Io.3068, from the Upper Tealby Clay, Dalby Hill, Lincs.

Paratype. A right valve BMNH Io.3069, from the same horizon and locality.

Diagnosis. Large Cytherelloidea, strongly compressed laterally. Dorsal rib complex, joined both anteriorly and posteriorly to the median rib. Shell surface strongly pitted, almost reticulate.

Measurements. R.V. Holotype Io.3068; length 0·80 mm., height 0·30 mm.

Description. Valves elongate, rather thin and strongly compressed laterally. The dorsal and ventral margins are subparallel but both show a weak concavity centrally in the larger right valves. Anterior margin semicircular, posterior margin rather subquadrate. The lateral surface bears a series of low ribs with shallow depressions between them. Posteriorly the valve is more inflated having a swollen area from which the longitudinal ribs run. Anteriorly there is a crescentic weakly-inflated marginal area equal in width to about one-sixth of the length. This anterior marginal 'strip' merges with the long margins, antero-dorsally and antero-ventrally. Three longitudinal ribs cross the lateral surface, the ventral one being most prominent. This rib runs in a weakly arcuate path a short distance above the ventral margin for the bulk of the length of the valve; posteriorly it is joined to the inflated posterior area but anteriorly it is separated from the marginal strip by a shallow groove. Ventrally from this rib there is a wide marginal shelf. The median rib starts posteriorly at 1/4 height running horizontally for a short distance and then bifurcates at 1/3 length. A long ventrally convex portion runs below the muscle pit terminating at 1/3 length whilst a short upper portion runs dorsally to join the dorsal rib at the mid-length of the valve. The dorsal rib is weak and short; it runs from a position on the dorsal margin at mid-length of the valve obliquely to join the anterior end of the lower branch of the median rib; it is entirely separate from the anterior marginal strip. Between the ribs the valve surface is strongly pitted.

Remarks. Cytherelloidea dalbyensis shows strong affinities to C. elongata Kaye 1963a from the Middle Barremian of East Yorkshire but is distinct in the pattern of the ribs from any other described Mesozoic species of the genus. From C. elongata, C. dalbyensis differs in shape and in being much less inflated with the ribs and depressions much less well differentiated; there are also differences in the arrangement of the ribs. In C. elongata the ventral rib runs along the margin and is joined anteriorly to a much broader anterior marginal 'strip'. The dorsal rib also runs to join this marginal strip and not the anterior end of the median rib.

Material. A right valve BMNH Io.3057, from the Upper Tealby Clay, Dalby Hill, Lincs.

Genus **Euryicythere** Oertli 1959

*Euryicythere* sp. B

Material. A carapace BMNH Io.3070, from the Lower Barremian, Dalby Hill.

Measurements. Carapace Io.3070; length 0·60 mm., height 0·32 mm.

Remarks. This extremely rare species is represented by a single closed carapace from Dalby Hill. It is closely related to the Hauterivian species *E. parisiorum* Oertli 1959 but differs in having a crest-like ridge running along the dorsal margin of the larger left valve. This crest also partially overlaps the dorsal margin of the right valve. A further difference is the stronger flattening of the lateral expansion ventrally forming a short blade-like longitudinal rib.

This occurrence is the first record of the genus in the Barremian though a worn but distinctly different specimen has been recorded (Kaye 1965c) from the Upper Aptian of the Isle of Wight.

Family **Cytheruridae** Müller 1894

Genus **Amphicytherura** Butler and Jones 1957

*Amphicytherura bartensteini* sp. nov.

Plate 33, figs. 5–8

Holotype. A female left valve BMNH Io.3071, from the Upper Tealby Clay, Dalby Hill, Lincs.

Paratypes. Six valves BMNH Io.3072–5, from the same horizon and locality.

Diagnosis. *Amphicytherura* with strongly reticulate lateral surface and marked keel-like ventral longitudinal rib.

Description. Valves subquadrate in outline, strongly laterally compressed. Dorsal and ventral margins straight and subparallel in the left valves. Anterior margin bluntly rounded, slightly asymmetrical ventrally; posterior drawn out into an acute point at \( \frac{3}{4} \) height. Lateral surface bearing a series of ribs. The most prominent is high keel-like, ventrally arcuate, ventral longitudinal; this rib runs from the anterior margin at \( \frac{1}{2} \) height across the lateral surface to terminate on the postero-lateral surface at mid-height. A further longitudinal rib runs below this one on the ventral undersurface following a ventrally identical path but reaching the margin postero-ventrally as well as antero-ventrally. A low smooth eye tubercle occurs antero-dorsally bearing a series of weak ribs on its upper surface. These ribs run weakly ventrally and antero-ventrally for a short distance across the lateral surface. A short rib runs from the dorsal margin at mid-length curving towards the posterior margin and terminating at mid-height. A weak node or rudimentary median rib occurs postero-laterally in certain specimens. The whole of the lateral surface is strongly reticulate. Duplicate narrow crossed by few straight radial pore canals. Hinge strongly amphidont, with boss-like divided terminal teeth and strongly divided median furrow in the right valve. Muscle group a row of four oval scars slightly inclined posteriorly with a single small oval scar anteriorly to them opposite the centre of the row.

Remarks. The strong reticulate ornamentation of this species and weak dorsal and median ribbing make it distinct from other members of the genus. It is one of the most abundant ostracods in the Upper Tealby Clay (Lower Barremian) of South Lincs. and is one of the few abundant ostracods from this formation not found in the Lower Tealby Clay and Tealby Limestone (U. Hauterivian) of North Lincs.

1848 Cythere inversa Cornuel, 244, pl. 1, figs. 12–14.

1963e Orthonotacythere inversa inversa (Cornuel); Kaye, 435, pl. 61, figs. 1–8, 12, 13.

Material. A left valve BMNH Io.3042, from the Upper Tealby Clay, Dalby Hill, Lincs.

Orthonotacythere problematica sp. nov.

Plate 33, figs. 3, 4

1965e Orthonotacythere sp. A. Kaye.

Holotype. A left valve BMNH Io.3060 from the Lower Barremian at Dalby Hill, Lincs.

Paratypes. One valve and one carapace BMNH Io.3061, from the Lower Barremian at Dalby Hill; 4 valves and 1 carapace BMNH Io. 2070–74, from the basal Atherfield Clay (Lower Aptian) Atherfield, Isle of Wight.
Diagnosis. Small *Orthonotacythera* with tuberculate lateral surface and ventral ridge increasing in height posteriorly. The ventral ridge is drawn out into an alaefor spine posteriorly.

*Measurements*. Holotype, L.V. Io.3060; length 0·47 mm., height 0·25 mm.

*Remarks*. This species originally described from the Lower Aptian of the Isle of Wight is here named. The Upper Tealby specimens are a little larger than the Aptian ones and have the ventral row of tubercles fused to form a prominent ridge.

**Genus ACROCYTHERE Neale 1960**

Material. A left valve BMNH Io.3059 from the Upper Tealby Clay, Dalby Hill.

Family TRACHYBERIDAE Sylvester-Bradley 1948
Genus CYTHEREIS Jones 1849

Cythereis blanda Kaye 1963d

Material. Two valves BMNH Io.3041 from the Upper Tealby Clay, Dalby Hill.

Cythereis cf. geometrica Damotte and Grosdidier 1963

Plate 33, figs. 16, 17

Material. Five valves and one carapace BMNH Io.3063–5 from the Upper Tealby Clay, Dalby Hill.

Remarks. Specimens related to C. geometrica Damotte and Grosdidier 1963 occur abundantly in the Upper Tealby Clay. The major difference between the two species is the stronger development of the median longitudinal ridge in the Lower Barremian forms. This feature shows similarities to C. geometrica fitoni Kaye 1965c from the Upper Aptian of the Isle of Wight but the Lincolnshire specimens lack the strong surface reticulation of the latter species. It is possible that the Lower Barremian forms are ancestral to the Aptian species.

Genus RANOCYTHEREIS Kaye 1965b

Ranocythereis caistroensis Kaye 1965b

Plate 33, fig. 13

Material. A right valve BMNH Io.3033 from the Upper Tealby Clay, Dalby Hill, Lincs.
Remarks. This species, previously recorded from the Lower Tealby Clay and Tealby Limestone (Hauterivian) of Nettleton, N. Lincs., occurs moderately rarely at Dalby Hill.

CONCLUSIONS

The Upper Tealby Clay at Dalby Hill is rich in ostracoda, both in numbers of individuals, and in number of species. The relative abundances of the thirty-two species and subspecies recorded are summarized as follows:

Abundant

Clithocytheridea brevis (Cornuel); Eucytherura nettletonensis Kaye; Schuleridea cf. bernoidensis Grosdidier; Amphicytherura bartensteini sp. nov.; Aerocythere hauetrioviana lavea Neale; Pseudobactocythere ornata Kaye; Pseudobactocythere vellicata (Chapman); Neocythere (N.) protovannesi Kaye; Protocythere heechi Triebel; Cythereis blanda Kaye; Cythereis cf. geosmetica Damotte and Grosdidier.

Common

Schuleridea rhomboidea Neale; Apatocythere ellipsoidea Triebel; Amphicytherura roemeri (Bartenstein); Cytheropteron (En.) nova Kaye; Acrocythere hauetrioviana (Bartenstein).

Frequent

Cythereilloidea ornata Weber; Apatocythere similans Triebel; Dolocytheridea intermedia Oertli; Orthocythere invisa invisa (Cornuel); Protocythere triplicata (Roemer); Ranocythereis caistorenensis Kaye.

Rare

Cythereilloidea dalbyensis sp. nov.; Bairdia sp.; Cytherura reticulosa (Chapman); Cytheropteron (C.) reightonensis Kaye; Eurythyocythere sp. B.; Cytheropteron (C.) ragoza Kaye; Cytheropteron (Infra.) exquisita Kaye; Orthocythereis blanda Kaye; Orthocythere problematica; Protocythere hornata Kaye.

The known range of the Upper Tealby Ostracoda and their geographical occurrence in England are shown in text-fig. 1.

The Upper Tealby fauna is Lower Barremian in age; with such species as Orthocythereis blanda, O. invisa invisa and, Pseudobactocythere ornata being only known previously from beds at this horizon at Speeton, E. Yorks. The fauna as a whole shows strong affinities to the lithologically similar Upper Hauterivian at Nettleton in N. Lincs., seventeen of the species recorded at Dalby Hill being also known from Nettleton; Lower Barremian strata are absent in N. Lincs. The clays of Upper Hauterivian and Lower Barremian age at Speeton differ markedly from those at Dalby, lacking the glauconite and iron carbonate ooliths. Nine species found at Dalby Hill occur in higher Barremian horizons at Speeton; the known range of one (Cythereis blanda) being extended down into the Lower Barremian. Four Hauterivian species: Eucytherura nettletonensis, Amphicytherura roemeri, Acrocythere hauetrioviana lavea, and Ranocythereis caistorenensis have their known ranges extended up into the Lower Barremian whilst

TEXT-FIG. 1. Known distribution of Ostracoda found in the Upper Tealby Clay at Dalby Hill.
the ranges of *Pseudobithycythere vellicata* and *Protocythere inornata* are extended down into the Lower Barremian. Two already described species, *Clithocythere brevis* and *Schuleridea bernouilliis* are recorded from England for the first time.

There is surprisingly little relationship between the fauna of the Upper Tealby Clay and the Upper Aptian Sutterby Marl formation. Only five species are common to the two, none of which are abundant at Sutterby. Stronger ties are found with the Aptian of South-east England, eight species occurring there and at Dalby Hill. None of the species extend into post-Aptian sediments.
